Description : Television broadcast transmitter

S/N serial number : -HW hardware status : -SW software status : -

Frequency Band [MHz] : 2450- 2483.5 MHz

Type of Modulation : 7M75D7W

Antenna : N Antenna-connector with rod antenna:

VLA2406LP (Procom FLX2412/2450 SMA)

VLA2400LP (WiMo 17010.10)

Power Supply : 13.8V<sub>DC</sub> normally powered by battery

Temperature Range :  $-20^{\circ}$ C to  $+55^{\circ}$ C

Max. power radiated: +35.5 dBm Max. power conducted: +36.3 dBm

FCC ID: VFB-CT2020HD-2300

IC: -/-

### Remark:

The signal is COFDM 2K modulated. There are 3 different sub-modulations (QPSK, 16QAM, 46QAM).

## 3. RF measurement testing

### 3.1 Description of test set-up

### 3.1.1 Radiated measurements

### **Description:**

### Measuring of Spurious/Harmonic Emissions using Substitution Method

(a) Set the EMI Receiver (for measuring E-Field) and Receiver #2 (for measuring EIRP) as follows:

Center Frequency : equal to the signal source

Resolution BW: 10 kHz for f < 1 GHz, 1 MHz for f > 1 GHz Video BW: 300 kHz for f < 1 GHz, 3 MHz for f > 1 GHz

Detector Mode : positive Average : off

(b) Load an appropriate correction factors file in EMI Receiver for correcting the field strength reading level

Total Correction Factor recorded in the EMI Receiver = Cable Loss + Antenna Factor

E(dBuV/m) = Reading(dBuV) + Total Correction Factor(dB/m)

(c) Select the frequency and E-field levels for ERP/EIRP measurements.

(d) Substitute the EUT by a signal generator and one of the following transmitting antenna (substitution antenna):

DIPOLE antenna for frequency from 30-1000 MHz or .HORN antenna for frequency above 1 GHz }.

(e) Mount the transmitting antenna at 1.5 meter high from the ground plane.

(f) Use one of the following antenna as a receiving antenna: .DIPOLE antenna for frequency from 30-1000 MHz or .HORN antenna for frequency above 1 GHz }.

- (g) If the DIPOLE antenna is used, tune it's elements to the frequency as specified in the calibration manual.
- (h) Adjust both transmitting and receiving antenna in a VERTICAL polarization.
- (i) Tune the EMI Receivers to the test frequency.
- (j) Lower or raise the test antenna from 1 to 4 meters until the maximum signal level was detected.
- (k) The transmitter was rotated through 360 o about a vertical axis until a higher maximum signal was received.
- (1) Lower or raise the test antenna from 1 to 4 meters until the maximum signal level was detected.
- (m) Adjust input signal to the substitution antenna until an equal or a known related level to that detected from the transmitter was obtained in the test receiver.
- (n) Record the power level read from the Average Power Meter and calculate the ERP/EIRP as follows:

P = P1 - L1 = (P2 + L2) - L1 = P3 + A + L2 - L1

EIRP = P + G1 = P3 + L2 - L1 + A + G1

ERP = EIRP - 2.15 dB

Total Correction factor in EMI Receiver # 2 = L2 - L1 + G1

Where: P: Actual RF Power fed into the substitution antenna port after corrected.

P1: Power output from the signal generator

P2: Power measured at attenuator A input

P3: Power reading on the Average Power Meter

EIRP: EIRP after correction

ERP: ERP after correction

- (o) Adjust both transmitting and receiving antenna in a HORIZONTAL polarization, then repeat step (k) to (o)
- (p) Repeat step (d) to (o) for different test frequency
- (q) Repeat steps (c) to (j) with the substitution antenna oriented in horizontal polarization.
- (r) Actual gain of the EUT's antenna is the difference of the measured EIRP and measured RF power at the RF port. Correct the antenna gain if necessary.

Page 10 of 55 Test report no.: 2-4869-01-03/07 Date: 2008-04-04

### **Conducted measurements**

The EUT's RF signal is coupled out by the antenna connector which is supplied by the manufacturer. The signal is first 10dB attenuated before it is connected to the spectrum analyzer. The specific losses of the signal path is first checked within a calibration. The measuerment readings on the spectrum analyzer are corrected by the specific test set-up loss. The attenuator and the spectrum analyzer are impedance matched on 50 Ohm.

none

#### 3.3 **Additional comments**

The system transmit frequency is programmable in 100 kHz steps in the range from 2450 to 2483.5 MHz.

We used three frequencies for testing. 2454 MHz, 2467 MHz and 2479 MHz. As the OBW of the signal is < 8 MHz, all emissions of the modulated signal are within the band limits.

### 3.12 MPE calculation

These equations are generally accurate in the far field of an antenna but will over predict power density in the near field, where they could be used for making a "worst case" prediction.

 $S = PG/4\pi R^2$ 

where S = power density (in appropriate units, e.g. mW/cm<sup>2</sup>)

P = power input to the antenna (in appropriate units e.g. mW)

G = power gain of the antenna in the direction of interest relative to the isotropic radiator

R = distance to the center of radiation of the antenna (appropriate units e.g. cm)

Or

 $S = EIRP/4\pi R^2$ 

where EIRP = equivalent isotropically radiated power

### Calculation:

(Calculated for max. EIRP)

EIRP: 34.8 dBm = 3020 mW

calculated at distance of 20 cm:

power density =  $3548.1 / 4\pi 20^2 = 0.60 \text{ mW/cm}^2$ 

Limit:

1mW/ cm<sup>2</sup> is the reference level for general public exposure according to the OET Bulletin 65, Edition 97-01 Table 1.
